

Finals Task 2. Inheritance

Problem School Performance

Note: You are to create 4 separate python files for this task:

- performer.py(base class)
- singer.py(sub class)
- dancer.py(sub class)
- test_class.py – following the required test cases

In a school musical performance, different types of performers participate. For this program, we will be implementing the performers.

Base Class - Performer:

- Properties:
 - `name` (type: str): Represents the name of the performer.
 - `age` (type: int): Represents the age of the performer.
- Constructor:
 - `__init__(self, name: str, age: int)`: Initializes the `name` and `age` properties.
- Getters
 - `get_name(self) -> str`: Returns the name
 - `get_age(self) -> int`: Returns the age

Subclass - Singer:

- Inherits From: `Performer`
- Additional Property:
 - `vocal_range` (type: str): Represents the vocal range of the singer.
- Constructor:
 - `__init__(self, name: str, age: int, vocal_range: str)`: Initializes the `name` and `age` properties by calling the parent class's constructor and sets the `vocal_range` property.
- Getter:
 - `get_vocal_range(self) -> str`: Returns the vocal range of the singer.
- Method:
 - `sing(self) -> None`: Prints "{name} is singing with a {vocal_range} range."

Subclass - Dancer:

- Inherits From: **Performer**
- Additional Property:
 - **dance_style** (type: str): Represents the dance style of the dancer.
- Constructor:
 - **__init__(self, name: str, age: int, dance_style: str)**: Initializes the **name** and **age** properties by calling the parent class's constructor and sets the **dance_style** property.
- Getter:
 - **get_dance_style(self) -> str**: Returns the dance style of the dancer.
- Method:
 - **dance(self) -> None**: Prints "{name} is performing {dance_style} dance."

Sample output for the Test Class

Test Cases

Test case 1

Should return ['John', 25] when invoking the methods [get_name(), get_age()] of the Performer class with properties { Name: 'John' , Age: 25 }.

Test case 2

Should return ['Emily', 28, 'Ballet'] when invoking the methods [get_name(), get_age(), get_dance_style()] of the Dancer class with properties { Name: 'Emily' , Age: 28, Dance Style: 'Ballet' }.

Test case 3

Should return 'Emily is performing Ballet dance.' when invoking the dance() method of the Dancer class with properties { Name: 'Emily' , Age: 28, Dance Style: 'Ballet' }.

Test case 4

Should make Dancer class a subclass of Performer class.

Test case 5

Should return ['Linda', 35, 'Soprano'] when invoking the methods [get_name(), get_age(), get_vocal_range()] of the Singer class with properties { Name: 'Linda' , Age: 35, Vocal Range: 'Soprano' }.

Test case 6

Should return 'Linda is singing with a Soprano range.' when invoking the sing() method of the Singer class with properties { Name: 'Linda' , Age: 35, Vocal Range: 'Soprano' }.
